Please use the following instructions to maximize ease of tagging and for correct placement. For best results, we recommend using the Enduro Livestock Tag Applicator.

Note:

Whilst tagging in **hot weather**, keep the male tags out of direct sunlight and **keep cool**.

We recommend **using disinfectant at all times**, and avoid tagging in **humid weather.**

Ensure the livestock are adequately restrained, preferably in body clamping equipment.

Loading the Applicator

1) **Hold** the applicator in one hand supporting **under the tagging head**

2) **Push** the **male clip** onto the pin fully and adjust to rest under the bump stop. Position on left side for applying to left ear.

3) Insert the Female Tag firmly into the central stage block, with locking aperture facing up.

4) Align both the male and female tags so that both tag apex are corresponding as shown. The apex of the tags should face towards the ear base when applying.

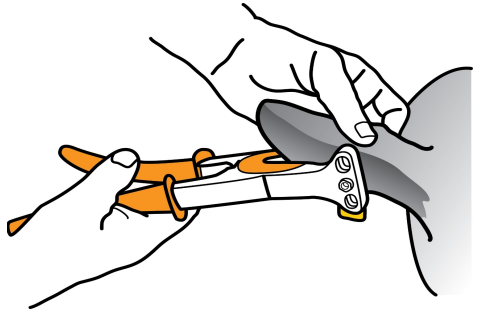

5) When applying to the right ear, position the tag more lengthways on the ear, with wider end of male tag facing outwards. Above diagram shows correct tag loading on applicator.

6) The male tag cannot be loaded if positioned within the jaws of the applicator. Best to use the bump stops to secure male tag.

Applying the Tag

6) Apply the tag with the male clip on the **back of the ear** positioning the tag between a **third to a half** way from the base of the ear.
